(57) **ABSTRACT**

The present invention relates to a composition comprising EK99P-1, a bacteriophage isolated from nature and capable of infecting *E. coli* type K99 so as to kill the same, as an active ingredient, and a method for preventing and treating *E. coli* type K99 infections using the said composition. According to the present invention, the bacteriophage EK99P-1, an active ingredient of the composition, has a killing activity against *E. coli* type K99 and has the genome represented by SEQ. ID. NO: 1.

**METHOD FOR TREATMENT OF
ESCHERICHIA COLI TYPE K99 INFECTIONS**

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a composition usable for preventing or treating *Escherichia coli* type K99 infections comprising a bacteriophage, isolated from nature and capable of infecting *Escherichia coli* type K99 so as to kill the same, as an active ingredient, and a method for preventing and treating *Escherichia coli* type K99 infections by using the said composition. More precisely, the present invention relates to a bacteriophage isolated from nature which is characterized by having the genome represented by SEQ. ID. NO: 1 and is capable of killing *Escherichia coli* type K99 specifically, a composition usable for preventing and treating *Escherichia coli* type K99 infections comprising the said bacteriophage as an active ingredient, and a method for preventing and treating *Escherichia coli* type K99 infections by using the said composition.

2. Description of the Related Art

Escherichia coli (*E. coli*) is largely divided into two kinds, one of them is non-pathogenic *E. coli* which is favorably and beneficially functioning to promote digestion with keeping balance normally with other enterobacteria in animal intestines and the other is pathogenic *E. coli* which has pilus that helps the adherence of the *E. coli* to intestine wall to be proliferated and produces enterotoxin causing diarrhea by irritating intestine wall.

Diarrhea caused by such pathogenic *E. coli* is common in almost every livestock farm in Korea. Diarrhea can be caused by single infection with pathogenic *E. coli*. However, when the livestock is mixed-infected with bovine rotavirus, coronavirus, and coccidium protozoa, etc, intestinal mucosa is so much damaged as to cause acute diarrhea and to make the symptoms worse.

Diarrhea caused by *E. coli* is reported world widely, and the incidence rate differs from hygienic control level of the livestock farm. Diarrhea caused by *E. coli* is also frequently reported in Korea as well, and is known as the most representative bacterial diarrhea. The representative causative strains for diarrhea caused by *E. coli* are F4 (K88), F5 (K99), F6 (987P), and F41. Even though they are different kinds of causative organisms, they are alike to cause diarrhea in almost every kinds of livestock. *E. coli* type K99 is known as the enterotoxigenic *E. coli* (ETEC) causing diarrhea in piglings or calves. The clustering of ETEC in the small intestine of the animals is regulated by the direct adhesion of bacteria to the intestinal epithelial cells. The clustering of ETEC intervenes peristalsis, mucus secretion and movement of villi in a host to cause diarrhea.

Damage by *E. coli* type K99 infections in livestock industry is huge. Therefore, it is urgent request to develop a method for the prevention and effective treatment of the infections. A variety of anti-bacterial agents have been used to prevent or treat *E. coli* type K99 infections. However, it is also urgent request to develop an alternative of the conventional anti-bacterial agents, considering the increase of antibiotic resistant bacteria.

The utilization of bacteriophage is now highly drawing our attention as an effective way of treating bacterial disease. In particular, our interests in bacteriophage grow with the preference of nature-friendly method. Bacteriophage is an extremely small microorganism infecting bacteria, which is generally called phage in short. Bacteriophage is proliferating in the inside of bacteria cells after infection. Upon

2

completion of the proliferation, offspring bacteriophages are coming out of the host cells with destroying the host bacteria. The infection of bacteriophage in bacteria is very unique and specific, so only specific bacteria can be infected with a specific bacteriophage. That is, there is a limitation in bacteria that can be infected with bacteriophage. Thus, bacteriophage can only kill specific target bacteria without affecting any other bacteria.

Bacteriophage was first found in 1915 when English bacteriologist Twort was studying on the phenomenon that micrococcus colony was being melted clearly by some reasons. And also, French bacteriologist d'Herelle noticed that *Shigella dysenteriae* was melted by something in filtrate of dysentery patient's feces and afterwards he separated bacteriophage independently by the following study and named it bacteriophage which meant 'eating bacteria'. Since then, bacteriophages corresponding to different pathogenic bacteria including *Shigella*, *Salmonella* and *Vibrio cholerae* have been continuously reported.

Owing to its capability of killing bacteria, bacteriophage has been in the center of our interest to fight with bacterial infection and studies followed thereon. However, since Fleming found out penicillin, antibiotics have been supplied and the study on bacteriophage has been limited in some east European countries and old Soviet Union. It was not until 2000 that the conventional antibiotics demonstrated their problems in use because of increasing antibiotic-resistant bacteria. So, once again, bacteriophage draws out attention as an alternative anti-bacterial agent that can take the place of the conventional antibiotics.

According to the recent tightening of regulation regarding the use of anti-bacterial agents by the government, interest in bacteriophage increases.

The present inventors have tried to develop a composition usable for preventing or treating *E. coli* type K99 infections by using a bacteriophage isolated from nature and capable of killing *E. coli* type K99 selectively and tried further to establish a method to prevent or treat *E. coli* type K99 infections by using the said composition. As a result, the present inventors succeeded in isolation of a proper bacteriophage from nature and obtainment of a sequence of the genome distinguishing the bacteriophage from others, leading to the completion of the present invention by confirming that the composition developed by the inventors could be effectively used for the prevention and treatment of *E. coli* type K99 infections.

SUMMARY OF THE INVENTION

It is an object of the present invention to provide a novel bacteriophage capable of killing *E. coli* type K99 selectively.

It is another object of the present invention to provide a composition usable for the prevention of *E. coli* type K99 infections comprising the said bacteriophage as an active ingredient which is capable of killing *E. coli* type K99 selectively by infecting *E. coli* type K99 and to provide a method for the prevention of *E. coli* type K99 infections using the same.

It is also an object of the present invention to provide a composition usable for the treatment of *E. coli* type K99 infections comprising the said bacteriophage as an active ingredient which is capable of killing *E. coli* type K99 selectively by infecting *E. coli* type K99 and to provide a method for the treatment of *E. coli* type K99 infections using the same.

It is further an object of the present invention to provide a disinfectant for the prevention and treatment of *E. coli* type K99 infections using the said composition.

3

It is also an object of the present invention to provide a water additive for the prevention and treatment of *E. coli* type K99 infections using the said composition.

It is also an object of the present invention to provide a feed additive for the prevention and treatment of *E. coli* type K99 infections using the said composition.

To achieve the above objects, the present invention provides a composition comprising a bacteriophage as an active ingredient which is capable of destroying *E. coli* type K99 by infecting *E. coli* type K99, and a method for preventing and treating *E. coli* type K99 infections by using the said composition.

The present invention also provides a disinfectant, a water additive, and a feed additive that can be used for the prevention or treatment of *E. coli* type K99 infections.

Advantageous Effect

As explained hereinbefore, the composition of the present invention and the method for preventing and treating *E. coli* type K99 infections using the same have an advantage of high specificity against *E. coli* type K99, compared with other conventional chemical compositions and methods using thereof. That is, this composition does not have any effect on other useful resident flora and can be used only for the purpose of preventing and treating *E. coli* type K99 infections. Thus, side effects are hardly accompanied. In general, when other chemicals such as the conventional antibiotics are used, general resident bacteria are also targeted and destroyed, resulting in the decrease of immunity in animals and bringing other side effects. In the meantime, the present invention provides an advantage of nature-friendly effect by using the composition containing natural bacteriophage as an active ingredient.

BRIEF DESCRIPTION OF THE DRAWINGS

The application of the preferred embodiments of the present invention is best understood with reference to the accompanying drawings, wherein:

FIG. 1 is an electron micrograph showing the bacteriophage EK99P-1.

FIG. 2 is a diagram illustrating the killing activity of the bacteriophage EK99P-1 against *E. coli* type K99.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

Hereinafter, the present invention is described in detail. The present invention provides a composition comprising the bacteriophage isolated from nature and characterized by having the ability to infect *E. coli* type K99 so as to kill the same, and a method for preventing and treating *E. coli* type K99 infections using the said composition.

The bacteriophage used as the active ingredient in the composition of the present invention is the bacteriophage EK99P-1 having DNA represented by SEQ. ID. NO: 1 as its genome. The bacteriophage EK99P-1 was isolated by the present inventors and deposited at Korean Collection for Type Cultures, Korea Research Institute of Bioscience and Biotechnology, 111 Gwahangno, Yuseong-gu, Daejeon 305-806, Republic of Korea on Nov. 15, 2011 (Accession No: KCTC 12075BP).

The present invention also provides a disinfectant, a water additive, and a feed additive that can be used for the prevention or treatment of *E. coli* type K99 infections.

4

The bacteriophage EK99P-1 included in the composition of the present invention is capable of killing *E. coli* type K99 efficiently, suggesting that the bacteriophage is effective in preventing or treating diarrhea caused by *E. coli* type K99. Therefore, the composition of the present invention is useful for the prevention and treatment of diarrhea caused by *E. coli* type K99.

The term "treat" or "treatment" in this description indicates (i) to suppress diarrhea caused by *E. coli* type K99; and (ii) to relieve diarrhea caused by *E. coli* type K99.

In this invention, the term "isolation" or "isolated" indicates the separation of bacteriophage from nature by using diverse experimental techniques and the process confirming the characteristics of the bacteriophage that can distinguish the bacteriophage itself from others. This term further includes the course of proliferating the bacteriophage by using biotechnology in order to make it a useful form.

The bacteriophage of the present invention includes the bacteriophage EK99P-1 and its variants as well. In this invention, "variants" indicate those bacteriophages which have minor variation(s) in the genomic sequence and polypeptides encoded thereby while retaining the same general genotypic and phenotypic characteristics as the bacteriophage EK99P-1. Variants of bacteriophage EK99P-1 encompass polymorphic variants. Bacteriophage EK99P-1 variants capable of performing the same or equivalent biological functions as bacteriophage EK99P-1 are particularly preferred.

The composition of the present invention can include pharmaceutically acceptable carriers such as lactose, dextrose, sucrose, sorbitol, mannitol, starch, acacia rubber, calcium phosphate, alginate, gelatin, calcium silicate, microcrystalline cellulose, polyvinyl pyrrolidone, cellulose, water, syrup, methyl cellulose, methylhydroxybenzoate, propylhydroxybenzoate, talc, magnesium stearate and mineral oil, but not always limited thereto. The composition of the present invention can additionally include lubricants, wetting agents, sweetening agents, flavors, emulsifiers, suspensions and preservatives.

The composition of the present invention contains the bacteriophage EK99P-1 or the variants thereof as an active ingredient. At this time, the bacteriophage EK99P-1 or the variants thereof are included at the concentration of 1×10^1 pfu/ml~ 1×10^3 pfu/ml or 1×10^1 pfu/g~ 1×10^{30} pfu/g, and more preferably at the concentration of 1×10 pfu/ml~ 1×10^{15} pfu/ml or 1×10^4 pfu/g~ 1×10^{15} pfu/g.

The composition of the present invention can be formulated by the method that can be performed by those in the art by using a pharmaceutically acceptable carrier and/or excipient in the form of unit dose or in multi-dose containers. The formulation can be in the form solution, suspension, or emulsion in oil or water-soluble medium, extract, powder, granule, tablet or capsule. At this time, a dispersing agent or a stabilizer can be additionally included.

The composition of the present invention can be produced in the form of a disinfectant, a water additive, and a feed additive, but not always limited thereto.

Practical and presently preferred embodiments of the present invention are illustrative as shown in the following Examples, Experimental Examples and Manufacturing Examples.

However, it will be appreciated that those skilled in the art, on consideration of this disclosure, may make modifications and improvements within the spirit and scope of the present invention.

5

Example 1

Isolation of Bacteriophage that can Destroy *E. coli* Type K99

A bacteriophage capable of killing *E. coli* type K99 was isolated from nature or from animal samples. *E. coli* used for the isolation was *E. coli* type K99, which was isolated previously by the present inventors and then identified as *E. coli* type K99 by the inventors.

Collected samples were loaded in TSB (Tryptic Soy Broth) medium (casein digest, 17 g/L; soybean digest, 3 g/L; dextrose, 2.5 g/L; NaCl, 5 g/L; dipotassium phosphate, 2.5 g/L) inoculated with *E. coli* type K99 ($\frac{1}{1000}$), followed by shaking culture for 3-4 hours at 37° C. Upon completion of the culture, centrifugation was performed at 3,000 rpm for 20 minutes and the supernatant was recovered. *E. coli* type K99 was inoculated in the recovered supernatant ($\frac{1}{1000}$), followed by shaking culture for 3-4 hours at 37° C. This procedure was repeated 5 times in total in order to increase bacteriophage titer if bacteriophage was included in the sample. After repeating the process 5 times, the culture solution proceeded to centrifugation at 8,000 rpm for 20 minutes. Then, the supernatant was filtered using 0.45 µm filter. The obtained filtrate was investigated by using general spot assay to see whether bacteriophage that could kill *E. coli* type K99 was included.

Spot assay was performed as follows. *E. coli* type K99 was inoculated in TSB medium ($\frac{1}{1000}$), followed by shaking culture at 37° C. overnight. Then, 3 ml of the obtained *E. coli* type K99 culture solution (OD₆₀₀: 2.0) was spread on TSA (Tryptic Soy Agar) plate medium (casein digest, 15 g/L; soybean digest, 5 g/L; NaCl, 5 g/L; agar, 15 g/L). The plate medium stayed on clean bench for about 30 minutes to let the spread solution is dried. After crying, 10 µl of the prepared filtrate was loaded on the plate medium whereon *E. coli* type K99 was spread, which was dried as it was for 30 minutes. After drying, the plate medium was standing-cultured at 37° C. for a day. It was then investigated whether the clear zone was formed on the spot where the filtrate was loaded. If the clear zone was formed thereon, it suggested that the bacteriophage that could kill *E. coli* type K99 was included therein. According to this procedure, the filtrate containing the bacteriophage that could destroy *E. coli* type K99 could be obtained.

Pure bacteriophage was isolated from the filtrate confirmed to contain the bacteriophage capable of killing *E. coli* type K99. The isolation of pure bacteriophage was performed by plaque assay. More precisely, one of plaques formed from plaque assay was recovered by using a sterilized tip, which was then added to *E. coli* type K99 culture solution, followed by culture for 4-5 hours. Upon completion of the culture, centrifugation was performed at 8,000 rpm for 20 minutes to obtain supernatant. *E. coli* type K99 culture solution was added to the obtained supernatant at the ratio of 1:50, followed by further culture for 4-5 hours. To increase the number of bacteriophage, this procedure was repeated at least 5 times and then centrifugation was performed at 8,000 for 20 minutes to obtain supernatant. Plaque assay was performed with the supernatant. Generally, the pure bacteriophage separation cannot be accomplished simply by performing the above procedure once. Thus, the previous steps were repeated again using one of plaques formed from plaque assay. After repeating the procedure at least 5 times, the solution comprising pure bacteriophage was obtained. The repetition of this pure bacteriophage separation processes was not finished until the sizes and shapes of plaques were all similar. The pure

6

bacteriophage separation was confirmed at last by the observation under electron microscope. If pure bacteriophage was not confirmed, the above processes were repeated again. Observation under electron microscope was performed by the conventional method, which was as follows: copper grid was soaked in solution containing pure bacteriophage, followed by negative staining with 2% uranyl acetate and drying thereof; and morphology was observed by taking pictures with transmission electron microscope.

The solution containing pure bacteriophage was purified as follows. *E. coli* type K99 culture solution was added to the pure bacteriophage solution at the ratio of 1:50, followed by culture for 4-5 hours. Upon completion of the culture, centrifugation was performed at 8,000 rpm for 20 minutes to obtain supernatant. To obtain enough amount of bacteriophage, the said process was repeated 5 times in total. The final supernatant was filtered with 0.45 µm filter, followed by precipitation by using polyethylene glycol (PEG). Particularly, PEG and NaCl were added to 100 ml of the filtrate (10% PEG 8000/0.5 N NaCl), which stood at room temperature for 2-3 hours. Then, centrifugation was performed at 8,000 rpm for 30 minutes to obtain bacteriophage precipitate. The obtained bacteriophage precipitate was suspended in 5 ml of buffer (10 mM Tris-HCl, 10 mM MgSO₄, 0.1% Gelatin, pH 8.0). This solution was called bacteriophage suspension or bacteriophage solution.

At last, purified pure bacteriophage was obtained and this bacteriophage was named bacteriophage EK99P-1, which was then deposited at Korean Collection for Type Cultures, Korea Research Institute of Bioscience and Biotechnology on Nov. 15, 2011 (Accession. No: KCTC 12075BP). The electron micrograph of bacteriophage EK99P-1 is presented in FIG. 1.

Example 2

Preparation and Sequencing of Bacteriophage EK99P-1 Genome

Bacteriophage EK99P-1 genome was prepared as follows using the bacteriophage suspension obtained in Example 1. To eliminate *E. coli* type K99 DNA and RNA which might be included in the suspension, DNase I and RNase A were added to 10 ml of the bacteriophage suspension (200 U each), which stood at 37° C. for 30 minutes. 30 minutes later, to inactivate DNase I and RNase A activity, 500 µl of 0.5 M ethylenediaminetetraacetic acid (EDTA) was added, which stood for 10 minutes. The solution stood at 65° C. for another 10 minutes, then 100 µl of proteinase K (20 mg/ml) was added, followed by reaction at 37° C. for 20 minutes to break the outer wall of the bacteriophage. Then, 500 µl of 10% sodium dodecyl sulfate (SDS) solution was added thereto, followed by incubation at 65° C. for one hour. One hour later, 10 ml of the mixed solution comprising phenol:chloroform:isoamylalcohol at the ratio of 25:24:1 was added thereto and the solution was well mixed. Centrifugation was performed at 13,000 rpm for 15 minutes to separate layers, among which the upper most layer was obtained. Isopropyl alcohol was added to the obtained layer at the volume ratio of 1.5, followed by centrifugation at 13,000 rpm for 10 minutes to precipitate genome. The precipitate was recovered, to which 70% ethanol was added, followed by centrifugation at 13,000 rpm for 10 minutes. The washed precipitate was collected, and vacuum-dried, which was then dissolved in 100 µl of water. Genome of the bacteriophage EK99P-1 was obtained by repeating the above processes.

The genomic sequence of the bacteriophage EK99P-1 was analyzed with the obtained genome at National Instrumentation Center for Environmental Management, Seoul National University, by using shotgun library construction. Particularly, the bacteriophage genome was cut by random shearing technique using Hydro-shear to obtain DNA fragments (1~6 kbp), which proceeded to end-repairing. The repaired DNA proceeded to electrophoresis on agarose gel. Then, gDNA fragments (inserts) in 3~5 kbp were obtained. The obtained DNA fragments of the bacteriophage were inserted in pEZSeq-kan vector by using T4 ligase (ligation) to establish library. The recombinant vector introduced with the DNA fragment of the bacteriophage was inserted, in DH10B', a kind of *E. coli*, via transfection using electric-shock. The transformant inserted with the plasmid was cultured, from which the plasmid containing the gene fragment was extracted by using plasmid purification kit (iNtRON Biotechnology). The size of the DNA fragment included in the plasmid was confirmed by electrophoresis and the final effective clones were selected. The plasmid of the selected clone was recovered, followed by gene sequencing. Contig map was made using the obtained gene sequences by the conventional method. The total gene sequence in 44,332 bp was analyzed by using primer walking. The confirmed genomic sequence of the bacteriophage EK99P-1 was presented by SEQ. ID. NO: 1.

Based on the genomic sequence of the bacteriophage EK99P-1, similarity to those sequences of the conventional bacteriophages was investigated by using BLAST (<http://www.ncbi.nlm.nih.gov/BLAST/>). As a result, the genomic sequence of the bacteriophage EK99P-1 demonstrated high similarity to those of Enterobacteria bacteriophage JL1 (GenBank Accession No. JX865427.2) and Sodalis bacteriophage SO-1 (GenBank Accession No. GQ502199.1) (92%), and Enterobacteria bacteriophage HK578 (GenBank Accession No. JQ086375.1) and Enterobacteria bacteriophage SSL-2009a (GenBank Accession No. FJ750948.1) (85% and 79%; respectively) with a little but clear difference.

Therefore, it can be concluded that the bacteriophage EK99P-1 is a novel bacteriophage which is completely different from any of the conventional bacteriophages.

Example 3

Killing Activity of Bacteriophage EK99P-1 to *E. coli* Type K99

Killing activity of the isolated bacteriophage EK99P-1 to *E. coli* type K99 was investigated. For the investigation, clear zone formation was first observed by spot analysis by the same manner as described in Example 1. 10 strains of *E. coli* type K99 were used in this investigation. They were isolated and identified by the present inventors as *E. coli* type K99 earlier. The bacteriophage EK99P-1 was confirmed to have the ability to kill all the *E. coli* type K99 used in this experiment. The result of this investigation is presented in FIG. 2. In addition, killing activity of the bacteriophage EK99P-1 to *Bordetella bronchiseptica*, *Enterococcus faecalis*, *Enterococcus faecium*, *Streptococcus mitis*, *Streptococcus uberis*, and *Pseudomonas aeruginosa* was further investigated. As a result, it was confirmed that the bacteriophage EK99P-1 did not have killing activity against those bacteria.

From the above results, it was confirmed that the bacteriophage EK99P-1 can be used as an active ingredient of the

composition formulated for the purpose of the prevention and treatment of *E. coli* type K99 infections.

Example 4

Application Example of Bacteriophage EK99P-1 for Preventing *E. coli* Type K99 Infection

10 100 µl the bacteriophage EK99P-1 solution (1×10^9 pfu/ml) was loaded to a tube containing 9 ml of TSB medium. Another tube containing 9 ml of TSB medium alone was also prepared. The *E. coli* type K99 culture solution was added to each tube (OD₆₀₀: 0.5). After *E. coli* type K99 was added to those tubes, they were all transferred to 37°C incubator, followed by shaking culture, during which the growth of *E. coli* type K99 was observed. As shown in Table 1, the growth of *E. coli* type K99 was suppressed in the tube treated with the bacteriophage EK99P-1 solution. In the meantime, the growth of *E. coli* type K99 was not inhibited in the bacteriophage free tube.

15

20

TABLE 1

	Suppression of <i>E. coli</i> type K99 growth		
	OD ₆₀₀		
	Culture 0 min.	Culture 15 min.	Culture 60 min.
Without bacteriophage solution	0.5	0.8	1.7
With bacteriophage solution	0.5	0.2	0.1

25

30

35

40

45

The above results indicate that the bacteriophage EK99P-1 of the present invention not only suppresses the growth of *E. coli* type K99 but also even destroys them, so that it can be used as an active ingredient for the composition formulated for the purpose of the prevention of *E. coli* type K99 infections.

Example 5

Treatment Example of *E. coli* Type K99 Infectious Disease Using Bacteriophage EK99P-1

Treating effect of the bacteriophage EK99P-1 was investigated in pigs infected with *E. coli* type K99. Particularly, two pig groups were arranged and each group had 4 weaning pigs at 25 days of age. The test animals were raised separately in laboratory animal facilities (1.1 m × 1.0 m), during which experiment was performed for 14 days. Environment was controlled in the thermal insulation facility. Temperature and humidity were regularly controlled and the floor of the pig room was cleaned every day. On the 7th day from the experiment started, all the pigs were orally administered with *E. coli* type K99 solution. The *E. coli* type K99 solution for oral administration was prepared as follows: *E. coli* type K99 was cultured in TSB medium at 37°C for 18 hours; The cells were recovered; and the recovered cells were diluted in saline (pH 7.2) at the concentration of 10^{10} CFU/ml. A day after the administration of *E. coli* type K99, the pigs were orally administered with the bacteriophage EK99P-1 (10 PFU) (bacteriophage solution treated group), twice a day, by the same method as used for the oral administration of *E. coli* type K99 solution. The control group pigs were not treated with the bacteriophage EK99P-1 (bacteriophage-non-treated

group). Feeds and drinking water were equally given to both the control and the experimental groups. All the test animals had been observed every day since they were administered with *E. coli* type K99 to see if they had diarrhea or not. The condition of diarrhea was examined by using diarrhea index. Diarrhea index was made by Fecal Consistency (FC) score (normal: 0, loose feces: 1, moderate diarrhea: 2, and explosive diarrhea: 3). The results are shown in Table 2.

TABLE 2

	Diarrhea index						
	Days after <i>E. coli</i> type K99 administration						
	0	1	2	3	4	5	6
Control group (bacteriophage solution non-treated)	1.0	1.5	1.5	1.25	1.0	1.0	0.75
Experimental group (bacteriophage solution treated)	0.5	0.5	0.25	0.25	0	0	0

The above results indicate that the bacteriophage EK99P-1 of the present invention is very effective in treating infectious disease caused by *E. coli* type K99.

Example 6

Preparation of Feed Additive and Feed

Feed additive containing bacteriophage EK99P-1 at the concentration of 1×10^9 pfu/g was prepared with bacteriophage EK99P-1 solution. The preparation method was as follows. Maltodextrin was added to the bacteriophage solution. Trehalose was added to the solution at the concentration of 5% by the total volume, followed by freeze-drying. The dried feed additive was pulverized to fine powder. For the drying process, either reduced pressure drying, drying at elevated temperature, or drying at room temperature could be used. For the control experiment, bacteriophage free feed additive was also prepared by using buffer (10 mM Tris-HCl, 10 mM MgSO₄, 0.1% Gelatin, pH 8.0) alone which was the same buffer as the one that was used for the preparation of bacteriophage solution, instead of bacteriophage solution.

The above two feed additives were mixed with feed for hog respectively at the weight ratio of 1:1,000.

Example 7

Preparation of Water Additive and Disinfectant

A water additive and a disinfectant were prepared by the same method because both were formulated in the same form and have only difference in their use. The water additive (or disinfectant) containing bacteriophage EK99P-1 at the concentration of 1×10^9 pfu/ml was prepared. The preparation method of water additive (or disinfectant) was as follows. Bacteriophage EK99P-1 was added to the buffer which was generally used for the preparation of bacteriophage solution at the concentration of 1×10^9 pfu/ml and then well mixed. For the control, the buffer itself was used as the bacteriophage free water additive (or disinfectant).

The prepared two different water additives (or disinfectants) were diluted with water at the ratio of 1:1,000, resulting in the final water additive or disinfectant.

Example 8

Investigation of Feeding Efficacy in Pig Farming

Improvement of feeding efficacy in pig farming was investigated by using the feeds, water, and disinfectants prepared in Examples 6 & 7. In particular, this investigation was performed by observing death rate. 30 piglets were divided into three groups (10 piglets/group) (group A: supplied with the feeds; group B: supplied with the water; group C: treated with the disinfectants). The investigation was performed for 4 weeks. Each group was divided into two subgroups of 5 piglets. Those subgroups were either treated with bacteriophage EK99P-1 (subgroup ①) or not treated with bacteriophage EK99P-1 (subgroup ②). The test piglets were 20 days old. Each group piglets were raised in an isolated cage separated from each other at regular intervals. Each subgroup was sorted and marked as shown in Table 3.

TABLE 3

Subgroup sorting and marking in feeding efficacy test on pig farming		
Subgroup sorting and marking		
	Bacteriophage EK99P-1+	Bacteriophage EK99P-1-
Feed	A-①	A-②
Water	B-①	B-②
Disinfectant	C-①	C-②

The piglets were supplied with the feeds prepared in Example 6 and the water prepared in Example 7 according to the conventional method as shown in Table 3. Disinfection was performed with the conventional disinfectant and the disinfectant of the present invention by taking turns, three times a week. The day when the disinfectant of the present invention was sprayed on, the conventional disinfectant was not used. The results are shown in Table 4.

TABLE 4

Group	Death rate (%)
A-①	0
A-②	40
B-①	0
B-②	40
C-①	0
C-②	40

From the above results, it was confirmed that the feeds, water and disinfectants prepared according to the present invention could help to reduce death rate in pig farming. Therefore, it was concluded that the composition of the present invention was effective in the improvement of feeding efficacy in pig farming.

Those skilled in the art will appreciate that the conceptions and specific embodiments disclosed in the foregoing description may be readily utilized as a basis for modifying or designing other embodiments for carrying out the same purposes of the present invention. Those skilled in the art will also appreciate that such equivalent embodiments do not depart from the spirit and scope of the invention as set forth in the appended Claims.

What is claimed is:

1. A method for treating *E. coli* type K99 infections in a subject animal, comprising administering to the subject a composition comprising the bacteriophage EK99P-1, harboring the genome represented by SEQ ID NO: 1, or variants thereof.

2. The method of claim 1, wherein the composition is administered to the subject animal in the form of a feed additive, a water additive, or a disinfectant.

3. The method of claim 1, wherein the bacteriophage EK99P-1 corresponds to Accession No. KCTC 12075BP.

60

4. The method of claim 3, wherein the composition is administered to the subject animal in the form of a feed additive, a water additive, or a disinfectant.
